PROFESSIONAL SUMMARY

Full-stack developer with experience in Python, JavaScript/TypeScript, and Dart, building web apps with React and FastAPI, mobile apps with Flutter, and SQL-backed systems. Shipped production features during a software development internship and built three full-stack projects end-to-end, including a Pokémon battle simulator with a real game engine, an AI-powered recommendation app, and a data pipeline built for a council client. Use Git, Docker, and GitHub Actions for deployment, and work regularly with AI coding tools like Copilot and Claude as part of the process.

TECHNICAL SKILLS

Languages : Python, Java, JavaScript, TypeScript, Dart.
Frontend & Mobile : React, Flutter, Tailwind CSS.
Backend & Data : FastAPI, Flask, REST APIs, MySQL, PostgreSQL, SQLite, OOP, SQL, Database Design.
Cloud & DevOps : Docker, GitHub, GitHub Actions, Azure, AWS (S3), Firebase Firestore, Vercel, Render, Git, BitBucket.
Others : Agile, Figma, Asana, Requirements Gathering, Debugging, Technical Documentation, Unit testing (Pytest).

WORK EXPERIENCE

Software Developer, Internship - Everything You Need **Jan 2024 – Jan 2025**

- Implemented dark/light mode theming (ThemeData + Provider) in Flutter, improving UI consistency app-wide.
- Fixed layout and responsiveness issues (Expanded, Flexible, MediaQuery), improving responsiveness by 20–30%.
- Implemented HR/Payroll features using Stripe, reducing manual staff processing time by 25%.
- Fixed bugs using Flutter DevTools and console logs, improving app stability by 40%.
- Used Git with BitBucket and tracked tasks on Asana in an Agile sprint workflow, completing 90%+ of sprint tasks on time.
- Built REST API integrations retrieving staff and rostering data from Firebase Firestore, with data validation and error handling, shipped features used in a real, live production app.

PROJECTS

PokeSim – Full-Stack Pokemon Battle Simulator https://poke-sim-two.vercel.app

- Engineered a full-stack battle simulator (React + FastAPI) with a Gen 4-accurate turn-based damage engine covering type effectiveness, STAB, critical hits, and EXP/leveling.
- Architected the backend across three FastAPI routers (battle, pokedex, teams) with dataclass-based domain models and a SQLite schema enforcing foreign-key constraints and cascade deletes.
- Designed a wave-survival "Rogue Mode" with difficulty scaling driven by live team state.
- Integrated the PokeAPI with in-memory caching to cut redundant network calls, then shipped a two-service GitHub Actions CI pipeline and deployed a fully playable, publicly accessible game across Vercel and Render.
- Built React frontend for team building and battle interactions, communicating with the FastAPI backend via a typed REST contract.

WatchWise AI – AI-Powered Movie/Anime Recommendation App https://watchwise-ai-puce.vercel.app

- Built and deployed a full-stack app (React/TypeScript, FastAPI) using TMDB and Gemini APIs to generate real-time options.
- Split the logic so TMDB pulls real data and Gemini ranks and explains the top picks, eliminating fake or hallucinated recommendations.
- Sped up backend response time by 75% (15s → 3–4s) using async API calls, caching, and connection pooling.
- Containerized the app with Docker and set up a GitHub Actions CI pipeline that runs tests and checks builds on every push, publicly deployed product.
- Supported two interchangeable LLM providers (Gemini default, OpenAI alternate) behind a single interface, with defensive parsing to handle malformed or prose-wrapped model output without crashing requests.

Smart Foot Traffic Monitoring — Capstone Project (Maryborough Council)

- Partnered directly with a local council stakeholder, translating recurring requirements meetings into a delivered data system.
- Engineered a Python data-cleaning pipeline (deduplication, missing-value handling, timezone normalization) feeding a MySQL database.
- Built a Flask REST API to process requests and serve heatmaps and statistical summaries to the front-end UI.
- Built a real-time terminal progress and logging system (Python, Rich) to monitor pipeline execution and surface processing errors.
- Tested data outputs, API responses, and visualisations end-to-end, delivering a validated system the council could use to view accurate, real foot-traffic patterns.

EDUCATION

Victoria University **August 2022 – June 2025**
Bachelor of Information Technology GPA 6.06/7.00
